Objective

Enthusiastic and detail-oriented fresher proficient in Python and SQL. Passionate about AI automation and LLMs, with a strong ability to handle data transformations and REST APIs. Eager to apply creativity and prompt engineering skills to build scalable workflows that drive effective B2B demand generation.

Work Experience

High Peak Software Pvt. Ltd.

May 2025 - Pursuing

Consultant (Data Science)

- Engineered a Finance chatbot using **Python** and **Chainlit**, integrating **Gemini 2.5 Pro LLM** and integrated **Google's A2A Agentic** approach via APIs to automate complex financial queries. Deployed the solution on a client's **Ubuntu Server** for reliable, scalable access.
- Built an **Automated AI-Powered Smart Audit system**, leveraging **OpenAI's LLM** and advanced **prompt engineering** to streamline the audit workflow, effectively qualifying and processing data with high accuracy.
- Developing an **Intelligent Heuristics** web scraper using **Python** and **Playwright** to automate data discovery and extraction from dynamic web sources, enabling efficient processing of large-scale datasets.

Education

Dayananda Sagar Academy Of Technology and Management

Dec 2024 - Pursuing

MCA(Master's Of Computer Applications)

- CGPA: Pursuing
- **Coursework:** OOPS Using Java, Comparison of Learning Algorithms(DSA), Operating System.

Vidyavahini First Grade College, Tumkur

Oct 2021 - Sept 2024

BCA(Bachelor's Of Computer Applications)

- CGPA: 8.93
- **Coursework:** Python, R Programming, C Programming, Database.

Projects

MorphDetect:- A DL model for Morphed Image Detection

- Designed and implemented a deep learning-based image classification system for detecting morphed and GAN-generated facial images using a custom Convolutional Neural Network (CNN). The model is trained from scratch to identify low-level texture inconsistencies and statistical artifacts commonly introduced by generative models, achieving strong detection accuracy while maintaining computational efficiency.
- **Tools Used:** Python, TensorFlow, Keras (ImageDataGenerator), NumPy, Matplotlib.

Image Classification Using Convolutional Neural Network Approach

- An image classification project using a Convolutional Neural Network (CNN) architecture, which is the gold standard for image-based machine learning tasks. Implemented with the MobileNetV2 architecture that optimizes both performance and computational efficiency.
- **Tools Used:** Python, TensorFlow, Keras [ImageDataGenerator], Matplotlib, Seaborn.

Text Extraction Using AWS Textract

- This project uses AWS Textract to extract text from a PDF stored in S3 and annotate it with bounding boxes. A GUI lets the user choose an output folder. The PDF is downloaded, processed, and converted to images with highlighted text areas. Extracted text and annotated images are saved locally, and the temporary file is deleted after processing.
- **Tools Used:** Python, AWS Textract and S3 bucket.

Technical Skills

Languages & Backend: Python, SQL, REST APIs.

AI & Automation: Chainlit, Large Language Models (LLMs), A2A.

Data Visualization: Power BI, Tableau, Microsoft Excel.

Tools & Environments: Git/GitHub, VS Code, PyCharm, Google Colab.

Certifications

Problem-Solving (Basics)

Oct 2024

HackerRank, Harishankaran K (CTO)

<https://www.hackerrank.com/certificates/353586fa937a> 

Python-Programming (Basics)

Oct 2024

HackerRank, Harishankaran K (CTO)
